**STUDY OF THERMOKARST STATE CHANGES IN WEST-SIBERIAN
PERMAFROST USING REMOTE SENSING DATA**

Map of permafrost zoning and oil fields in West Siberia

Thermokarst lakes as objects of geocryological studies

The most effective geoindicators of cryogenic changes of permafrost territories under global warming using remote sensing are thermokarst lakes. Below is a fragment of space image Landsat-7 (07.08.1999г.) with indicated objects of geocryological studies:
1 - thermokarst lakes; 2 – drained lakes (khasyreys)

Climatic data

Long-term time numbers of mid-annual values of **air temperature**, **quantity of atmospheric precipitation** and other climatic parameters, received at **156 meteorological stations** in West-Siberian territory for the period **1955 - 2006 years** have been analyzed.

Remote sensing data

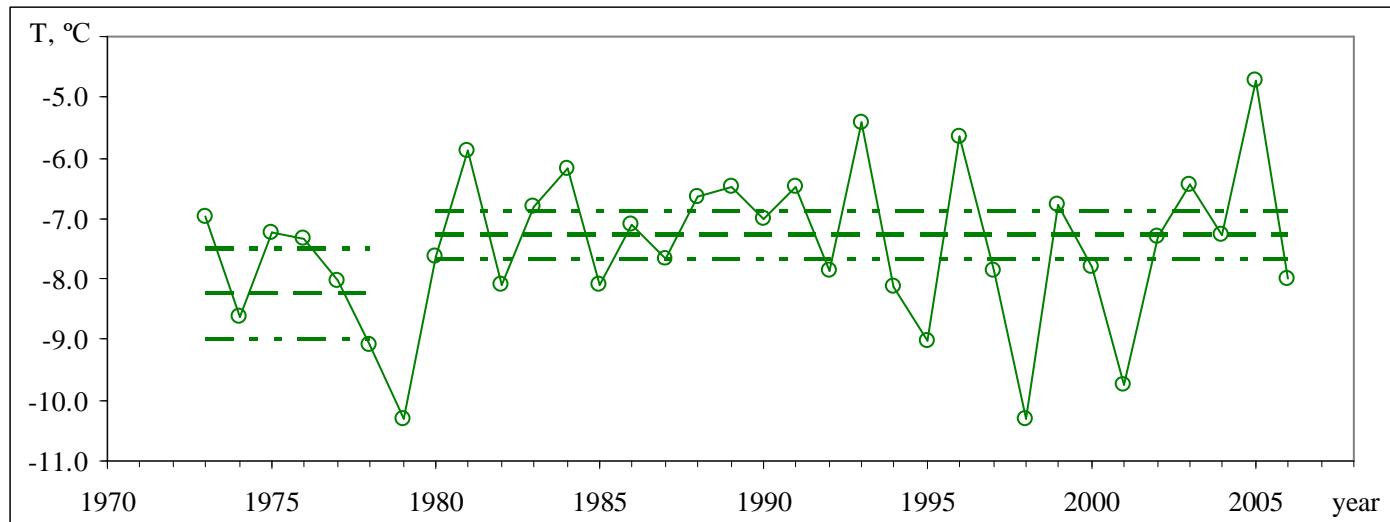

Collections of space images of 1973-2006 years

- Landsat - 1 (scanner MSS), 10.08.1973
- Landsat - 5 (scanner MSS), 27.07.1984
- Landsat - 5 (scanner MSS), 26.06.1988
- Landsat - 4 (scanner TM), 01.08.1988
- Landsat - 5 (scanner TM), 20.09.1989
- Resurs - F2 (scanner MK 4), 14.06.1993
- Landsat - 7 (scanner ETM), 07.08.1999
- Landsat - 7 (scanner ETM), 03.08.2001
- Landsat - 7 (scanner ETM), 03.07.2002
- Spot - 5 (scanner HRV), 20.07.2005
- ERS-2 – 2005, June – 2006, September

Методические вопросы анализа геокриологических изменений

**Methodical questions
of analysis
of geocryologic changes**

Temperature change in territory of Continuous and Discontinuous permafrost section (Yamal-Nenets region)

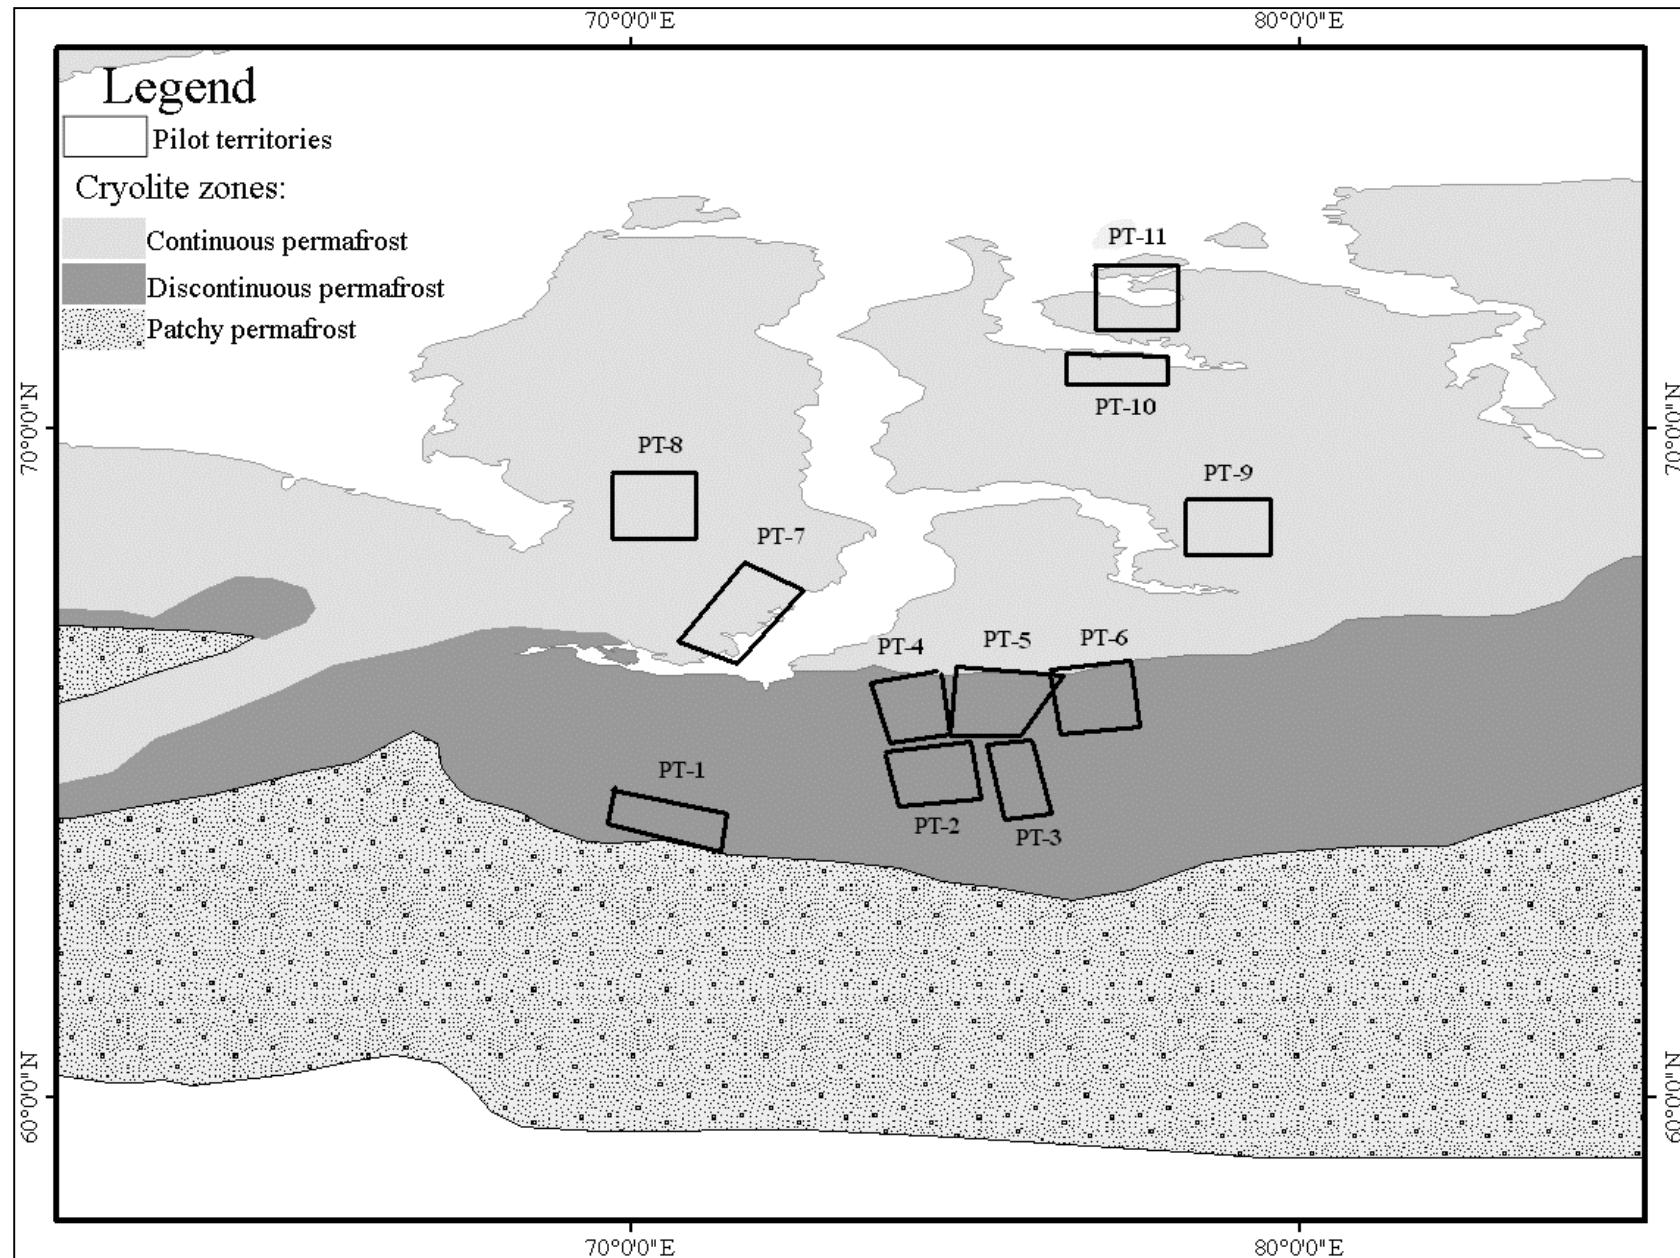

Mid-annual air temperature in the second period (1980-2006 years) in comparison with the period of 1973-1979 years has increased 0,96 $^{\circ}\text{C}$

— - - - Mean value

— - - - - confidence limit for 90 % confidence probability
